Solar-driven electrochemical water splitting cells, known as photoelectrochemical (PEC) cells, with integrated photoelectrode (s) that directly convert solar to chemical energy via generation of solar hydrogen fuels, have also been studied and developed extensively.

<div class="df\_qntext">What are photoelectrochemical water splitting and hydrogen storage processes?

The observed photoelectrochemical water splitting and hydrogen storage processes were described as follows:  
(10)  $x \text{ H}_2\text{O} + x \text{ h}^+ \rightarrow x \text{ H}^+ + x \text{ O}_2$  photoanode  
(11)  $\text{M} + x \text{ H}^+ + x \text{ e}^- \rightarrow \text{M H}$  x cathode with M and  $\text{h}^+ / \text{e}^-$  being the hydride-forming metal (Pd) and photogenerated holes and electrons (Eq. (6)), respectively.

<div class="df\_qntext">What role do environmental policies play in solar-driven (photo)electrochemical technologies?

Environmental policies, such as renewable energy subsidies and grants, environmental regulations and carbon taxes, will also have an important role in the broader implementation of solar-driven (photo)electrochemical technologies.
