<div class="df\_qntext">How do I connect a flammable gas sensor to a power supply?

VCC pin: It should be connected to the power supply's positive terminal (5V) to provide the necessary power to the sensor. GND pin: It should be connected to the power supply's negative terminal (0V) to complete the electrical circuit. DO pin: This is a digital output pin that indicates the presence of flammable gases.

<div class="df\_qntext">How does a gas sensor work?

When the gas concentration increases, the voltage output also increases, and when the gas concentration decreases, the voltage output decreases accordingly. Additionally, the MQ2 gas sensor includes two LED indicators: PWR-LED indicator: This LED serves as a power indicator, indicating whether the sensor is receiving power.

<div class="df\_qntext">How does the mQ2 gas sensor work?

The MQ2 gas sensor provides two options via a digital output pin and analog output pin. Please note that the MQ2 gas sensor does not provide information about each gas separately. Instead, it gives information about the gas combination or the presence of gasses as a whole.

<div class="df\_qntext">How long do I need to warm up the mQ2 gas sensor?

The MQ2 gas sensor requires a warming-up period before it can be used effectively. Here's what you need to know: When using the sensor for the first time after a long period of storage (around a month or more), it is necessary to warm it up for 24-48 hours. This ensures that the sensor operates accurately.

<div class="df\_qntext">What does a PWR-led indicate on a gas sensor?

When the sensor is properly powered, the PWR-LED is turned on, providing visual confirmation of the sensor's operational state. DO-LED indicator: This LED is directly linked to the DO pin of the sensor. It indicates the presence of gas concentration based on the value received from the DO pin.
