Our online tool ASPlight calculates the required variables, such as accumulator volume, pressure ratio and maximum and minimum operating pressures, taking into account real gas behaviour.

What is a hydraulic accumulator?

Hydraulic accumulators, also known as hydropneumatic accumulators or pressure accumulators, are used in hydraulic systems to maintain fluid pressure, store and recapture fluid energy, reduce pressure peaks, power chassis suspensions, and dampen shock, vibration and pulsations.

What happens if pressure drops in a hydraulic accumulator?

If system pressure falls, the compressed gas expands again and forces the stored fluid into the hydraulic circuit. The hydropneumatic accumulator guarantees a fast reaction in case of pressure drop. Diaphragm accumulators are the smaller ones, from 0,07 liter up to 3,5 liter, with fluid operating pressure up to 210/250 bar or 330/350 bar.

What types of accumulators are available?

HYDRAULICS ARE YOUR HOME: The know-how of our hydraulic specialists extends to all accumulator types, such as bladder accumulators, piston accumulators or diaphragm accumulators and metal bellows accumulators. We will gladly assist you in selecting the right design and in determining the suitable accumulator model.

What is the reference value for the accumulator temperature?

The reference value for the temperature is $T_0 = 20 \text{ }^\circ\text{C}$. Depending on your selection, the result will be the accumulator volume / exchange volume or the upper and lower operating pressures. You will also receive information on the volume ratio, pressure ratio and pre-charge pressure at T_{\min} and T_{\max} .
