Is grid-forming inverter control technology a viable solution?

Grid-forming inverter control technology has been discussed in recent years as a potential solution since present-day IBR control methodology may not be sufficient to ensure grid security in a future inverter dominated system. What is a grid-forming inverter? Why may it be needed? What are its performance requirements?

What is grid-forming inverter?

Grid-forming inverter can potentially improve the stability of the system. dVOC allows users to specify power setpoints for each inverter. If no setpoints are given, dVOC subsumes VOC control and inherits all its favorable dynamical properties. dVOC is asymptotically stable in 100% inverter system. Validated in NREL hardware test bed.

What is a grid forming control?

Grid-Forming: The primary objective of grid-forming controls for IBRs is to maintain an internal voltage phasor. When grid-forming controls are applied in bulk power system (BPS) connected IBRs, the voltage phasor is held constant in the sub-transient to transient time frame.

Can a residential PV inverter provide limited power in off-grid mode?

To our knowledge there are few commercial PV residential inverters (like SMA Sunny Boy) that can provide limited power (up to 15A at 120V) in off-grid mode if enough sunlight is available. Residential Inverter will be disconnected from the grid and will not inject any current to grid during outage.

The distinction between grid-forming (GFM) inverter and grid-following (GFL) inverter is profound. GFM inverters provide damping to frequency swings in a mixed system, while GFL inverter can aggravate frequency problems with increased penetration. Rather than acting as a source of inertia, the GFM inverter acts as a source of damping to the system.
