Abstract: Compared to traditional metal cable, high-temperature superconductor (HTS) cable is a promising candidate for the energy transmission in space solar power stations due to its great advantage in high power density and efficiency.

<div class="df_qntext">Can superconducting cable power transmission reduce spacecraft energy transfer?

These cables can reduce energy losses and simplify the conventional cable transmission by eliminating the need for voltage conversion equipment, thus reducing the launch weight and costs of spacecraft. This paper analyzes the feasibility of superconducting cable power transmission in space spacecraft energy transfer.

<div class="df_qntext">Why is Solar Integrated supercapacitor not suitable for long-time discharge?

It is due to the low energy density and fast charge/discharge rates of supercapacitors that are not capable of storing large amounts of energy. Hence, the solar integrated supercapacitor device is less suitable as a durable power source for long-time discharge.

<div class="df_qntext">Can solar cells and supercapacitors be integrated for different operating conditions?

Integrating solar cells and supercapacitors for different operating conditions is another challenge to be addressed. In a silicon solar cell integrated device, the silicon extraction and purification leads to greenhouse gas emissions.

<div class="df_qntext">Can high-temperature superconductivity unlock a new era of energy-efficient technology?

Researchers at the University of Houston's Texas Center for Superconductivity have achieved another first in their quest toward ambient-pressure high-temperature superconductivity, bringing us one step closer to finding superconductors that work in everyday conditions -- and potentially unlocking a new era of energy-efficient technologies.

Recent empirical investigations, such as those revealing ideal gas-like correlations at the onset of superconductivity in intercalated superconductors, motivate this ...
