

<div class="df_qntext">What is a fixed speed pumped storage plant?

A fixed speed pumped storage plant is one that can only regulate power while generating electricity. While state-of-the-art variable speed technology allows for power regulation in specific ranges both while generating and pumping, providing additional flexibility to support grid stability.

<div class="df_qntext">What is a pumped storage power plant?

Pumped Storage Power Plant has gained a high level of attention in recent years, mainly because of its ability to act as a large-scale energy storage option and to improve power system flexibility.

<div class="df_qntext">What is pumped storage?

Pumped storage is economically and environmentally the most developed form of storing energy during base-load phases while making this energy available to the grid for peaking supply needs and system regulation. Voith has delivered this technology since its inception. The conventional reversible units are operated at nominal rotational speed.

<div class="df_qntext">What is a pumped storage power station?

Their special feature: They are an energy store and a hydroelectric power plant in one. If there is a surplus of power in the grid, the pumped storage power station switches to pumping mode - an electric motor drives the pump turbines, which pumps water from a lower reservoir to a higher storage basin.

<div class="df_qntext">Are pumped storage facilities a viable solution for multi-functional power plants?

As multi-functional power plants, pumped storage facilities have a high potential to meet this challenge, because their technology is based on the only long-term, technically proven and cost-effective form of storing energy on a large scale, thereby making it available at short notice.

<div class="df_qntext">Are variable-speed pumps a good choice for pumped storage projects?

Because variable-speed technology is well suited to integration of variable renewable generation, many of the proposed new pumped storage projects are considering variable-speed machines. Variable-speed pump-turbines have been used since the early to mid-1990s in Japan and the late 1990s in Europe (where the term "adjustable speed" is common).
