Second-Life Battery Use in Stationary Applications The main purpose of this section is to explore the specific practical usage of second-life batteries for stationary applications.

<div class="df_qntext">Can vehicle-to-grid and second-life batteries reduce resource use?

We investigate the potential of vehicle-to-grid and second-life batteries to reduce resource use by displacing new stationary batteries dedicated to grid storage.

<div class="df_qntext">Should EV batteries be reused for a second life application?

From this point on, battery reuse for a second life application is economically preferred to recycling. EV batteries possess several characteristics that make them optimal for stationary applications, such as being designed to withstand i) high instantaneous currents and ii) rapid charge/discharge cycles .

<div class="df_qntext">Can a decommissioned battery be given a second life?

In most cases, decommissioned batteries that are still fully functional can be given a second life in stationary energy storage systems, for example. This means that the resource-intensive battery cells remain sustainable and in use for as long as possible.

<div class="df_qntext">Are second-life batteries good for the environment?

From an environmental perspective, the second-life batteries' main advantage is that it eliminates the need for manufacturing new batteries, but this comes with various other environmental issues. Firstly, it takes either 250 tons of Spodumene (a mineral ore) or 750 tons of brine rich in minerals to manufacture a single ton of lithium-ion .

<div class="df_qntext">What is a second-life battery (SLB)?

Second-life batteries (SLBs) are EV batteries whose capacity has degraded to an extent, typically between 60% and 80% of the original capacity, making them unsuitable for continued use in EVs, but still serviceable as stationary storage for the grid 13, 14.
