MIT engineers created a carbon-cement supercapacitor that can store large amounts of energy. Made of just cement,water,and carbon black,the device could form the basis for inexpensive systems that store intermittently renewable energy,such as solar or wind energy.

<div class="df_qntext">Can a supercapacitor store energy?

MIT engineers have created a "supercapacitor" made of ancient,abundant materials,that can store large amounts of energy. Made of just cement,water,and carbon black (which resembles powdered charcoal),the device could form the basis for inexpensive systems that store intermittently renewable energy,such as solar or wind energy.

<div class="df_qntext">Can concrete-like supercapacitors be used for bulk energy storage?

These properties point to the opportunity for employing these structural concrete-like supercapacitors for bulk energy storagein both residential and industrial applications ranging from energy autarkic shelters and self-charging roads for electric vehicles,to intermittent energy storage for wind turbines.

<div class="df_qntext">Are supercapacitors a good investment?

Supercapacitors are great candidates for energy boosting,power,and memory backup. However,they suffer from low-energy density,relatively high cost,and carbon footprint problems due to their electrode materials,such as commonly used activated carbons (ACs).

<div class="df_qntext">What can carbon-cement supercapacitors do?

Another potential application for carbon-cement supercapacitors is for building concrete roadwaysthat could store energy produced by solar panels alongside the road and then deliver that energy to electric vehicles traveling along the road using the same kind of technology used for wirelessly rechargeable phones.

<div class="df_qntext">Can material precursors be used for energy storage in supercapacitors?

Herein,we investigate such a scalable material solution for energy storage in supercapacitors constructed from readily available material precursorsthat can be locally sourced from virtually anywhere on the planet,namely cement,water,and carbon black.
