<div class="df\_qntext">What is the operating principle of a nitrogen generator utilizing adsorption technology?

The operating principle of a nitrogen generator utilizing the adsorption technology is based upon the dependence of the adsorption rates featured by various gas mixture components upon pressure and temperature factors.

<div class="df\_qntext">What is a single-acting shock absorber?

A single-acting shock absorber, which is the most commonly used design for commercial transports, is shown in Fig. 5.1. This type of shock strut absorbs energy by first forcing a chamber of oil against a chamber of dry air or nitrogen and then compressing the gas and oil.

<div class="df\_qntext">What is aeration in a shock absorber?

The aeration phenomenon in a shock absorber is defined as a process by which gas, typically nitrogen, is circulated through, mixed with, or dissolved in oil being used as a working fluid in shock absorbers.

<div class="df\_qntext">Why is gas included in shock absorbers?

Gas is included in shock absorbers under certain pressure, separately from the oil, to provide compressibility to allow for the rod displacement volume compensation.

<div class="df\_qntext">How do shock absorbers work?

While shock absorbers serve the purpose of limiting excessive suspension movement, their intended main purpose is to damp spring oscillations. Shock absorbers use valving of oil and gasses to absorb excess energy from the springs. Spring rates are chosen by the manufacturer based on the weight of the vehicle, loaded and unloaded.

<div class="df\_qntext">Why are oleo-pneumatic shock absorbers used in commercial transport?

The high gear and weight efficiencies associated with the oleo-pneumatic shock absorber make it the preferred design for commercial transports.

OverviewDescriptionEarly historyTypes of vehicle shock absorbersTheoretical approachesSpecial featuresShock absorber and strut comparisonSee alsoA shock absorber or damper is a mechanical or hydraulic device designed to absorb and damp shock impulses. It does this by converting the kinetic energy of the shock into another form of energy (typically heat) which is then dissipated. Most shock absorbers are a form of dashpot (a damper which resists motion via viscous friction).
